\*Please refer to accessories and options.

## FEATURES

These OALC air cooled water chillers offer the ultimate combination of energy saving design, superior engineering features and flexibility of application as required by today'S market.

- \* These chillers incorporate the newest advanced controller. This controller monitors analog and digital inputs to achieve precise control & protective functions of the air cooled water chiller units. This microprocessor controller is complete with all the hardware and software necessary to control the chiller unit and insures its efficiency and reliability.
- \* Compact unit design and excellent serviceability.
- \* All packaged chillers incorporate compact water coolers with low fin copper tubes and expanded into a steel tubular sheet which offer efficient water flow as well as heat transfer design resulting in optimal unit performance.
- \* All units incorporate separate subcooler circuit which is integral to the condenser surface. This additional subcooling circuit provides superior system performance.
- \* High Energy Efficiency Ratio (EER) semi-hermetic reciprocating compressors provided in these units.
- \* Single point power connection to minimize job site installation cost and time.
- \* Completely wired control panel provides all the necessary operating and safety controls.
- \* All compressors are with independent refrigeration circuits.
- \* Compressors are either with part winding or across-the-line start depending on the models.
- \* Low noise condenser fans, direct Drive.
- \* All fans are propeller type, top discharge, provided with protective grille mounted on top panel within the unit casing.
- \* All condenser fan motors are totally enclosed air over type (TEAO) with class "F" winding insulation and ball bearings.

## STANDARD SPECIFICATIONS

## CAPACITY CONTROL

The Classic packaged chillers incorporate stepped load shedding as required by most energy management systems. Capacity control is achieved by cycling compressor ON/OFF and cylinder unloading. The use of unloading provides good part load capacities.

On multiple compressor units, capacity is controlled by a combination of cylinder unloading and compressor staging. See the following table for the standard and optional capacity control for each unit.

MODEL NUMBER	% FULL LOAD CAPACITY CONTROL	
	OPTIONAL	OPTIONAL
OALC 010	100-50-OFF	100-50-HGBP-OFF

OALC 220	100-87-75-62-50-37-25-12-OFF	100-87-75-62-50-37-25-12-HGBP-OFF
OALC 240	100-87-75-62-50-37-25-12-OFF	100-87-75-62-50-37-25-12-HGBP-OFF

## NOTES:

1. Cylinder unloading on lead compressor optional .
2. HGBP=Hot gas bypass available on lead compressor for all models.
3. HGBP modulates to approximately 50% of its unloaded capacity . Example: OALC 100 with HGBP( $25\% \times 0.5 = 12.5\%$  minimum capacity).

## COMPRESSORS

All compressors are semi-hermetic reciprocating type and are conforming to ARI 520. These compressors are equipped with internal motor protection and also provided with vibration isolators. Each compressors has lock-out devices to protect it from short cycling when shutdown by the safety controls.

## CONDENSERS COILS

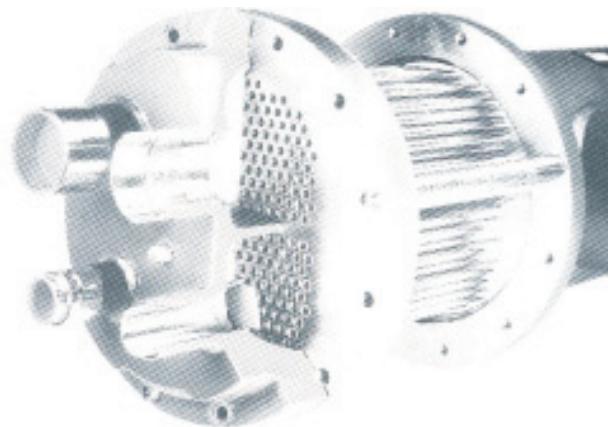

Coils are corrugated fin and tube type, constructed of seamless 3/8" dia copper tubes of thickness 0.016 inch, mechanically bonded to aluminum fins for maximum heat transfer efficiency. As an option, corrugated copper or coated aluminum fins may be provided. The fins have full self spacing collars which completely cover each tube. The staggered tube design improve the thermal efficiency. A separate sub-cooling circuit is provided to prevent flashing of liquid refrigerant. End plates and tube support sheets are 14 gauge galvanized steel, formed to provide structural strength. Each coil is pressure tested in the factory at not less than 450 psi air pressure.

## STANDARD SPECIFICATIONS

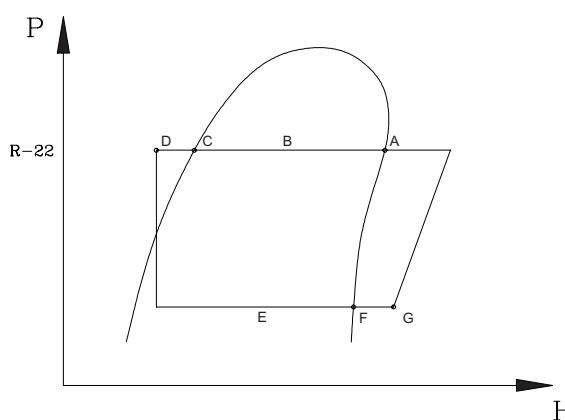

## COMPACT DESIGN SHELL AND TUBE WATER COOLERS

The DX shell & tube chillers made of low fin copper tubes expanded into a heavy steel tubular sheets.

The chiller shell & baffles are constructed of steel and brass respectively. The barrel is insulated with heavy closed cellular foam insulation. All chiller barrels are fitted with vent and drain connection.

## MOLLIER DIAGRAM

- A : Condensing temperature reference = temperature corresponding to the pressure at the inlet of the condenser.  
B : Means condensing temperature.  
C : Temperature corresponding to the pressure at the outlet of the condenser.  
D : Liquid temperature (subcooling = C - D)  
E : Means evaporating temperature  
F : Evaporating temperature reference = temperature corresponding to the pressure at the outlet of the evaporator  
G : Suction temperature (superheat = G - F)

	DESIGN PRESSURE, PSIG	TEST PRESSURE, PSIG	DESIGN PRESSURE, PSIG	TEST PRESSURE, PSIG
	147	220	246.5	300

## CABINET

All units are of heavy gauge (G-90) galvanized steel. Steel sheet panels are galvanized by hot dip process of lock-forming quality followed by backed on electrostatic polyester coating. Removable access panels are provided for easy maintenance purpose.

## STANDARD SPECIFICATIONS

**CONDENSER FANS**

Condenser fans are constructed with aluminum or steel or PPG or PAG blades on steel hubs with direct driven motors. All fans are statically and dynamically balanced to operate at minimum noise and vibration. Fan blades are designed with appropriate pitch angle which result in maximum airflow through the condenser coil.

**CONDENSER FANS MOTOR**

All fan motors shall be three phase with "F" class winding insulation and ball or roller bearings for high ambient application.

Inherent thermal protection of automatic reset type. ( optional )

**MICROPROCESSOR CONTROLLER** ( optional )

The control works on the state of art microprocessor technology. This controller monitors analog and digital inputs to achieve precise control & safety functions of the unit.

The software works on the proportional Integral (PI) algorithm for precise control logic.

The simple to use push button keyboard allows to access the operating conditions, control set points & alarm history clearly displayed on a multi-line back illuminated LCD panel.

An easy to install **serial port/modem option** allows remote monitoring of the operating parameters. With corresponding windows software, the system allows data to be viewed in tabular or graphic format and as well interact with system set up.

**Display Information:**

In the normal operating mode the 20 x 4 characters LCD panel display the system status, the temperature of the water inlet & outlet, the set point, run time of the compressor & the alarm history.

Easily accessible measurements for each circuit include the following suction and discharge pressure

- oil pressure
- compressor status
- fan status
- liquid line solenoid status
- Unit/Compressor run time

The control temperature is continuously displayed on the 3 Digit 7 segments LED Display. The 3 LED lights indicate the Power ON, Menu adjustment and Fault .

**System Protection:**

- The following system protection is provided to ensure system reliability:
- Compressor winding overheating
- Low suction pressure
- High discharge pressure
- Freeze protection
- Low oil pressure
- Sensor error
- Time delay - Anti recycle time for compressor

**STANDARD CONTROL & SAFETY DEVICES**

**MICROPROCESSOR CONTROLLER:** This controller monitors analog and digital inputs to achieve precise control & safety functions of the unit.( optional )

**COMPRESSOR MOTOR INTERNAL OVERLOAD:** The internal overload protects the compressor and senses the motor winding temperature in case of overload.

**STARTERS:** The starter is operated by the control circuit and provides power to the compressor motors. These devices are rated to handle safely both RLA and LRA of motors.

**UNDER VOLTAGE AND PHASE PROTECTION:** Protects against low incoming voltage as well as single phasing, phase reversal and phase imbalance by de-energizing the control circuit. It is an automatic reset device, but it can be set up for manual reset.

**CRANKCASE HEATERS:** Each compressor has crankcase heater. The compressor crankcase heater is always on when the compressors are de-energized. This protect the system against refrigerant migration, oil dilution and potential compressor failure.

**SAFETY VALVE:** This valve protects the unit against high discharge pressure in the system due to malfunction of high pressure switches.

**HIGH PRESSURE SWITCH:** This switch provides an additional safety protection in the case of excessive discharge pressure.

**ACCESSORIES**

**UNIT ON-OFF SWITCH:** ON-OFF switch is provided for manually switching the unit control circuit.

**INDICATOR LIGHTS:** lights indicates power ON to the units .

**THERMOSTATIC EXPANSION VALVE:** Thermostatic expansion valve is used to regulate the refrigerant flow to the water cooler and maintain a constant superheat.

**FILTER DRIER (REPLACEABLE CORE TYPE):** Refrigerant circuits are kept free of harmful moisture, sludge, acids and oil contaminating particles by the filter drier.

**CONTROL CIRCUIT TRANSFORMER ( optional ) :** A factory mounted and wired control circuit transformer is furnished eliminating the need for running a separate 115 volt power supply to the unit control circuit.

**SIGHT GLASS:** A moisture indicating sight glass installed in the liquid line. An easy-to-read color indicator shows moisture contents and provides a mean for checking the system refrigerant charge.

**LIQUID LINE SOLENOID VALVE:** Closes when the compressor is off to prevent any liquid refrigerant from accumulating in the water cooler during the off cycle.

**DISCHARGE LINE MUFFLER ( optional ) :** Discharge line mufflers are installed to eliminate noise due to refrigerant pulsation.

**VIBRATION ELIMINATOR:** To eliminate the vibration transmitted from the compressor to the pipings and unit structure.

**HOT GAS BYPASS SYSTEM (optional) :** Hot gas bypass is provided on the lead circuit to permit operation of the system down to 50% of its unloaded capacity. Under low ambient condition, it controls temperature by eliminating the need to cycle the compressor on and off, ensuring narrow temperature swing and lengthen the life span of the compressor .

**WATER FLOW SWITCH (optional ):** Paddle type field adjustable flow switch for water cooler circuits. Interlock into unit safety circuits so that the unit will remain off until water flow is determined.

**UNIT MOUNT SPRING ISOLATORS (optional):** Designed for 1" deflection. This housed spring assemblies have a neoprene friction pad on the bottom to prevent vibration transmission.

**CIRCUIT BREAKERS:** Protects against compressor branch circuit fault. When tripped (manually or automatically), the breaker opens the power supply to the compressor and control circuit through auxiliary contacts.

## NOTES:

Compressor with cylinder unloader.

1. All compressors operate at 1750 RPM @ 60Hz and 1450 RPM @ 50Hz.
2. Cooler vent and drain size are 1/2" MPT.
3. All barrels are single face refrigerant connection.

## NOTES:

- \* Compressor with cylinder unloader.
- 1. All compressors operate at 1750 RPM @ 60Hz and 1450 RPM @ 50Hz.
- 2. Cooler vent and drain size are 1/2" MPT.
- 3. All barrels are single face refrigerant connection.

**SELECTION PROCEDURE (English units)****DESIGN REQUIREMENTS**

The following design requirements must be known to select a package chiller

1. Required cooling capacity in tons
2. Leaving chilled water temperature in °F (LCWT)
3. Chilled water flow rate in PM
4. Chilled water cooling range in °F (water in temp. – water out temp.)
5. Design ambient temperature
6. Minimum ambient temperature
7. Altitude
8. Electrical power supply

**SAMPLE SELECTION**

Select an Air Cooled Packaged chiller for the following conditions:

Required system capacity is 90 tons at 54°F entering chilled water and 44°F leaving water. Design ambient temperature is 95°F.

Altitude is 2000 feet above sea level.

Water cooler fouling factor is 0.00010. Power supply: 380V-3Ph-60Hz.

**STEP-1: UNIT SELECTION**

Entering the capacity performance data at given LCWT and ambient temperature. OALC100 chiller unit at sea level will produce 100.3 tons and 113.5kW compressor power input at 44°F leaving chilled water temperature with 10°F water temperature difference and 95°F ambient temperature.

For the conditions required, the unit actual cooling capacity when corrected for altitude (0.99) and fouling factor (1.0).

Capacity =  $100.3 \times 0.99 \times 1.0 = 99.2$  Tons, which then exceeds the requirements. So the selection is correct.

**STEP-2: CHILLED WATER FLOW (PM):**

$$\text{Water PM} = \frac{\text{Required capacity (Tons)} \times 24}{\text{Cooling Range, } \Delta T} = \frac{90 \times 24}{10^{\circ}\text{F}} = 216 \text{ PM}$$

Referring to pressure drop chart, pressure drop at 216 PM = 11.5 ft. of water for selected model.

**STEP-3: ELECTRICAL**

Refer to electrical data at 380V-3Ph-60Hz, the main power wire size for OALC100 is to be sized for a minimum circuit ampacity (MCA) of 325.4 Amps and maximum over current protection (MOCP) of 450 Amps.

**STEP-4: CHILLED WATER PUMP SELECTION**

For chilled water pump selection, add all pressure drop in the closed chilled water loop piping to the pressure drop calculated in step 2.

**STEP-5: LCWT CORRECTION**

When a corrected LCWT is used, cooler pressure drop must also be corrected for new LCWT.

Refer to table-3. Add correction factor to design leaving chilled water temperature (LCWT) when chilled water temperature range is above 10°F and subtract correction from design leaving chilled water temperature (LCWT) when water temperature range is below 10°F.

**EXAMPLE:**

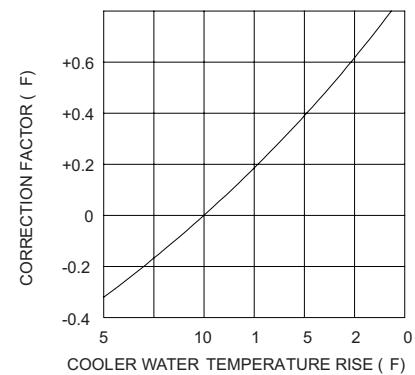

If LCWT rise is 12.5°F, enter correction curve at 12.5°F and read the correction factor of 0.2. The corrected LCWT is  $44 + 0.2 = 44.2$ °F.

**NOTE:** 1. When the chilled water temperature rise is less than 5°F, the high water flow rate will result to excessive pressure drop. In such cases, contact factory for special selection of a cooler with wider baffle spacing.  
2. Please refer to water pressure drop curves.

ELEVATION ABOVE SEA LEVEL (FT.)	CAPACITY CORRECTION FACTOR
0	1.00
2000	0.99
4000	0.98
6000	0.97

**TABLE - 1**

0.00010	1.000	1.000	ARI-550/590-98
0.00025	0.992	0.997	ARI-590-86
0.00050	0.978	0.990	ARI-590-81
0.00075	0.965	0.984	
0.00100	0.951	0.978	

**TABLE - 2****TABLE - 3**

## SELECTION PROCEDURE (Metric units)

**DESIGN REQUIREMENTS**

The following design requirements must be known to select a proper package chiller:

1. Required cooling capacity in kilowatt (kW)
2. Leaving chilled water temperature in °C (LCWT)
3. Chilled water flow rate in LPS
4. Chilled water cooling range in °C (water in temp. – water out temp.)
5. Design ambient temperature
6. Minimum ambient temperature
7. Altitude
8. Electrical power supply

**SAMPLE SELECTION**

Select an Air Cooled Packaged chiller for the following conditions:

Required system capacity is 300 kW at 12 entering chilled water and 6°C leaving water. Design ambient temperature is 35°C.

Altitude is 600 meter above sea level.

Water cooler fouling factor is 0.000018. Power supply: 380V-3Ph-60Hz.

**STEP-1: UNIT SELECTION**

Entering the capacity performance data at given LCWT and ambient temperature. OALC100 chiller unit at sea level will produce 346.3 kW and 111.8 kW compressor power input at 6°C leaving chilled water temperature with 6°C water temperature difference and 35°C ambient temperature.

For the conditions required, the unit actual cooling capacity when corrected for altitude (0.99) and fouling factor (1.0).

Capacity =  $346.3 \times 0.99 \times 1.0 = 342.84$  kW, which then exceeds the requirements. So the selection is correct.

**STEP-2: CHILLED WATER FLOW (LPM):**

$$\text{Water LPS} = \frac{\text{Required capacity (kW)} \times 0.239}{\text{Cooling Range, } \Delta T} = \frac{300 \times 0.239}{6^\circ\text{C}} = 12 \text{ LPS}$$

Referring to pressure drop chart, pressure drop at 12 LPS with pressure drop of 27.5 kPa of water for selected model.

**STEP-3: ELECTRICAL**

Refer to electrical data at 380V-3Ph-60Hz, the main power wire size for OALC100 is to be sized for a minimum circuit ampacity (MCA) of 325.4 Amps and maximum over current protection (MOCP) of 450 Amps.

**STEP-4: CHILLED WATER PUMP SELECTION**

For chilled water pump selection, add all pressure drop in the closed chilled water loop piping to the pressure drop calculated in step 2.

**STEP-5: LCWT CORRECTION**

When a corrected LCWT is used, cooler pressure drop must also be corrected for new LCWT.

Refer to table-3. Add correction factor to design leaving chilled water temperature (LCWT) when chilled water temperature range is above 6°C and subtract correction from design leaving chilled water temperature (LCWT) when water temperature range is below 6°C.

**EXAMPLE:**

If LCWT rise is 7.4°C, enter correction curve at 7.4°C and read the correction factor of 0.11. The corrected LCWT is  $6^\circ\text{C} + 0.11 = 6.11^\circ\text{C}$ .

**NOTE:** 1. When the chilled water temperature rise is less than 3°C, the high water flow rate will result to excessive pressure drop. In such cases, contact factory for special selection of a cooler with wider baffle spacing.  
2. Please refer to water pressure drop curves.

ELEVATION ABOVE SEA LEVEL (Meter)	CAPACITY CORRECTION FACTOR
0	1.00
600	0.99
1200	0.98

TABLE - 2

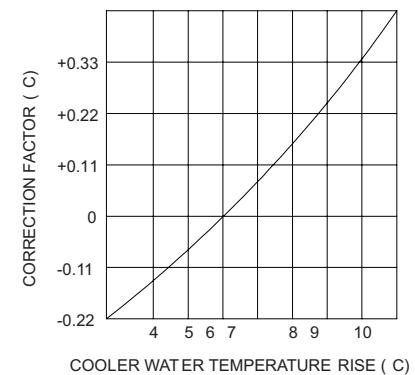

TABLE - 3

## ETHYLENE GLYCOL SOLUTION CAPACITY CORRECTION (Antifreeze)

When operating in areas with temperatures below 32°F (0°C), cooler protection in the form of Ethylene glycol solution (brine solution) is required to protect cooler from low ambient freeze-up. This brine solution must be added to water loop to bring down the freezing point with a difference of 15°F (8°C) below minimum operating ambient temperature.

Ethylene glycol solution causes a variation in unit performance. To obtain the effective performance, it is necessary to multiply the water performance data by correction factors corresponding to the ambient temperature or Ethylene glycol percentage indicated in the following table.

ETHYLENE GLYCOL % BY WEIGHT	0%	12%	22%	30%	36%	41%	46%	50%
Freezing point of Ethylene glycol solution	0°C (32°F)	-5°C (23°F)	-10°C (14°F)	-15°C (5°F)	-20°C (-4°F)	-25°C (-13°F)	-30°C (-22°F)	-35°C (-31°F)
Ambient temperature	8.3°C (47°F)	3.3°C (38°F)	-1.7°C (29°F)	-6.7°C (20°F)	-11.7°C (11°F)	-16.7°C (2°F)	-21.7°C (-7°F)	-26.7°C (-16°F)
Cooling capacity correction factor	1.0	0.985	0.980	0.974	0.970	0.965	0.964	0.960
Water flow correction factor	1.0	1.02	1.04	1.075	1.11	1.14	1.17	1.20
Pressure drop correction factor	1.0	1.07	1.11	1.18	1.22	1.24	1.27	1.30

**EXAMPLE:** English system- Determine Ethylene glycol percentage by weight and correction factors at 38°F ambient temperature.

From the above table, Ethylene glycol water solution concentration (percentage by weight) corresponding to 38°F ambient temperature is 12% by weight.

Find the correction factors corresponding to 38°F ambient temperature from the table.

Cooling capacity correction factor is 0.985, Flow correction factor is 1.02, Pressure drop correction factor is 1.07.

Apply these correction factors for corrected system performance values.

TONS (E.G. SOLUTION) = Tons (water) x Cooling capacity correction factor.

BRINE (E.G. SOLUTION) FLOW (GPM) = Flow (water) x Flow correction factor.

BRINE (E.G. SOLUTION) PRESSURE DROP = Water pressure drop (Ft.) x Pressure drop correction factor.

**EXAMPLE: Metric** system- Determine Ethylene glycol percentage by weight and correction factors where 3.3°C ambient temperature.

From the above table, Ethylene glycol water solution concentration (percentage by weight) corresponding to 3.3°C ambient temperature is 12% by weight.

Find the correction factors corresponding to 3.3°C ambient temperature from the table.

Cooling capacity correction factor is 0.985, Flow correction factor is 1.02, Pressure drop correction factor is 1.07.

Apply these correction factors for corrected system performance values.

KW (E.G. SOLUTION) = KW (water) x Cooling capacity correction factor.

BRINE (E.G. SOLUTION) FLOW (L/S) = KW (water) x Flow correction factor.

BRINE (E.G. SOLUTION) PRESSURE DROP = Water pressure drop (kPa) x Pressure drop correction factor.

**Note:** Correction factors apply to published chilled water performance rating from 40°F to 50°F (4.4°C to 10°C) LCWT.

**LEGEND**  
KW PD EER

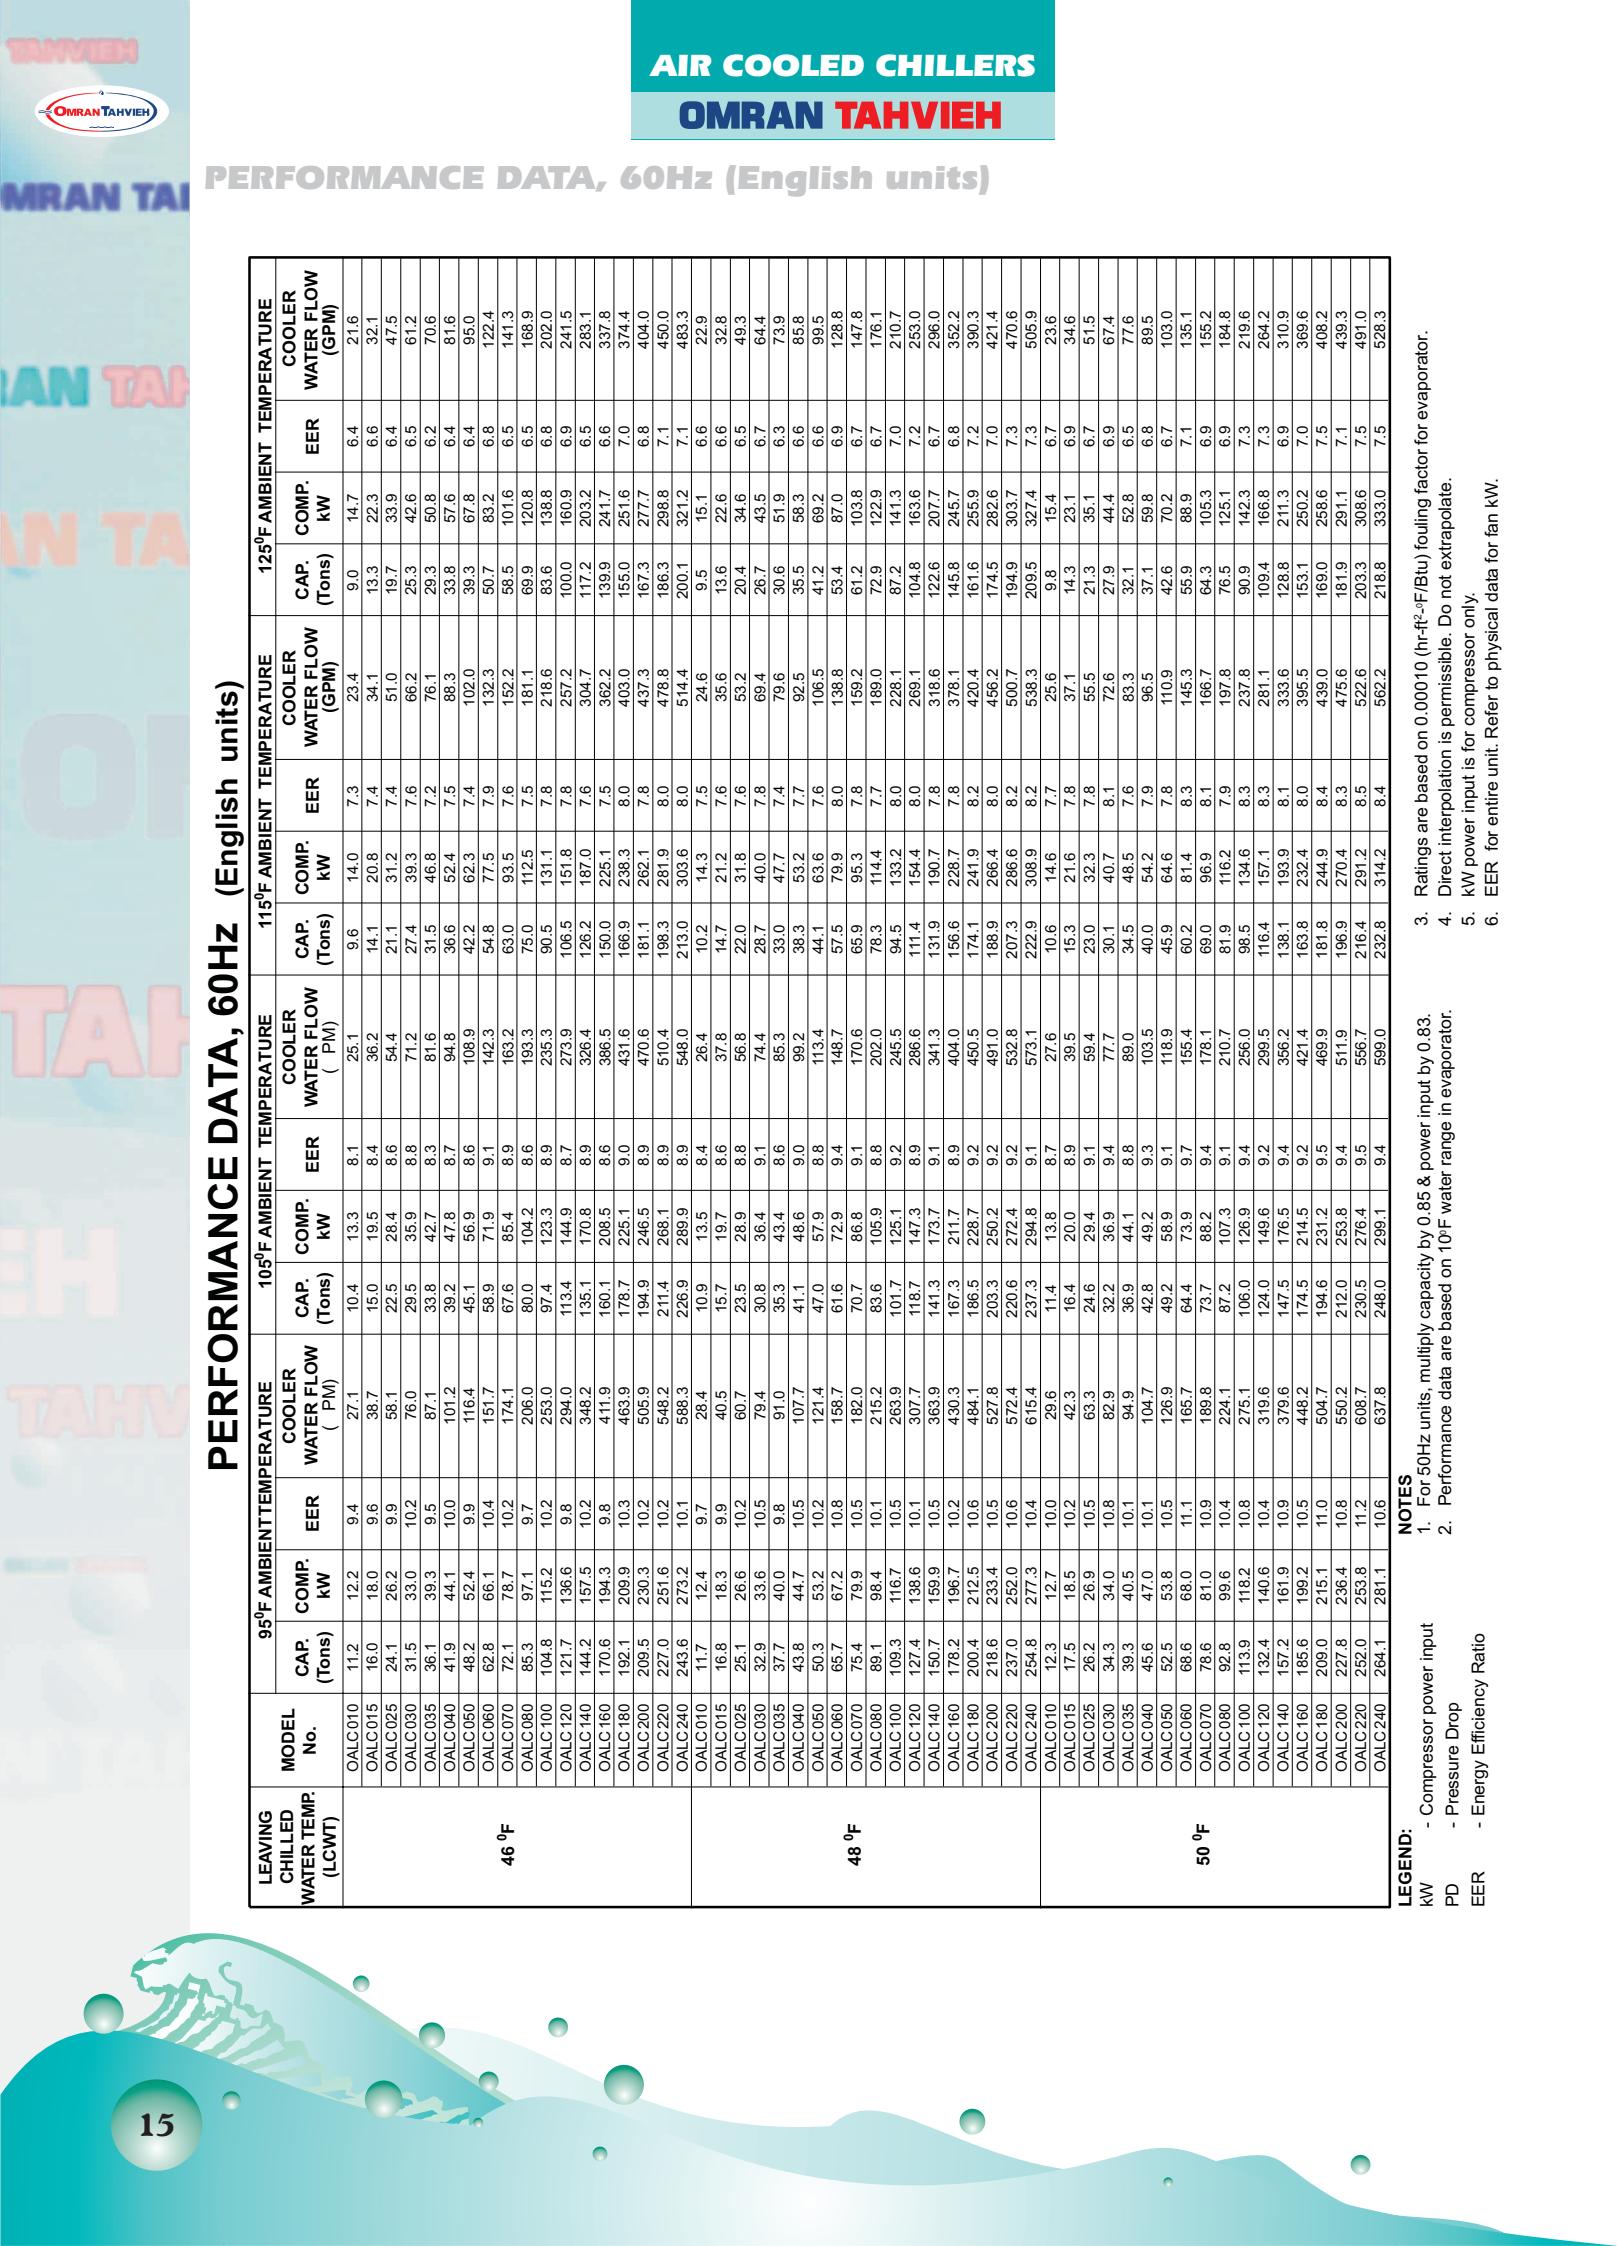

NOTES

- 1. For 50Hz units, multiply capacity by 0.85 & power input by 0.83.
  - 2. Performance data are based on 10°F water range in evaporator.

3. Ratings are based on 0.00010 (hr-ft<sup>2</sup>-°F/Btu) fouling factor for evaporator.

4. Direct interpolation is permissible. Do not extrapolate.

5. kW power input is for compressor only.

**LEGEND:**  
 MCA - Minimum Circuit Ampacity  
 MOCP - Maximum Over Current Protection  
 RLA - Rated Load Amps  
 LRA - Locked Rotor Amps  
 CB - Circuit Breaker  
 MTA - Must Trip Amps  
 FLA - Full Load Amps  
 HP - Horse Power  
 FCA - Fan Circuit Amps

**NOTES**  
 1. Main power must be supplied from a single field supplied disconnects, using dual element time delay fuse or circuit breaker.  
 2. The maximum incoming wire size is 500 mcm. On units having MCA greater than 500 mcm wire, the factory supplied power terminal block will accept two parallel field wires per phase.

3. The compressor crankcase heaters must be energized for 12 hours before the unit is initially started or after a prolonged power disconnection.  
 4. Minimum and maximum unit supply voltages are shown in the tabulated data above.  
 5. Neutralline required on 380V-3PPh-60Hz & 380/415V-3PPh-50 Hz power supply only.

NOTES

1. Main power must be supplied from a single field supplied and mounted fused disconnects, using dual element time delay fuse or circuit breaker.
2. The maximum incoming wire size is 500 mcm. On units having MCA greater than 500 mcm wire, the factory supplied power terminal block will accept two parallel field wires per phase.
3. The compressor crankcase heaters must be energized for 12 hours before the unit is initially started or after a prolonged power disconnection.
4. Minimum and maximum unit supply voltages are shown in the tabulated data above.
5. Neutral line required on 380V-3Ph-60Hz & 380/415V-3Ph-50 Hz power supply only.

## WATER SIDE PRESSURE DROP

- NOTES**
- POWER SUPPLY, REFER TO UNIT NAMEPLATE.
  - COPPER CONDUCTORS ONLY.
  - FUSED DISCONNECT SWITCH OR CIRCUIT BREAKER TO BE PROVIDED BY END USER WITH RATING AS RECOMMENDED BY MANUFACTURER.
  - POWER MUST BE SUPPLIED TO CRANKCASE HEATER FOR MINIMUM OF 12 HOURS PRIOR TO SYSTEM START UP.  
IF POWER IS OFF 6 HOURS OR MORE, CRANKCASE HEATER MUST BE ON FOR 12 HOURS BEFORE OPERATING THE SYSTEM.  
FAILURE TO FOLLOW THESE INSTRUCTIONS MAY RESULT IN COMPRESSOR DAMAGE.
  - NEUTRAL LINE REQUIRED ON 380V-3Ph-60Hz & 380/415V-3Ph-50Hz POWER SUPPLY ONLY.

**TYPICAL MICROPROCESSOR CONTROLLER (OPTIONAL)****Sequence of Operation**

The following describes the sequence of operation for a two compressor reciprocating chiller unit. Operation is similar for a one or four compressor unit. For initial start-up, the following conditions must be met:

- All power supplied to the unit shall be energized for 12 hours.
- Control power switch on for at least 5 minutes.
- All safety conditions satisfied.
- Press ESC on the microcomputer keypad.
- Chilled water pump running and chilled water flow switch contact closed.
- Customer control contact closed, if any.

**STAGE - ON SEQUENCE**

Staging ON & OFF sequence, shall be accomplished by the Leaving water temperature control selection.

**Stage #1:**

If the leaving water temperature is greater than the stage 1- ON water temperature set point value, the compressor #1, liquid line solenoid & unloader solenoid (lead compressor only) shall be switched ON.

The first stage of capacity is now on-line. **The unit is now at 25% capacity .**

As discharge pressure of compressor #1 rises, the corresponding fans energized according to the fans stage-ON set point. If the discharge pressure falls below the fan stage-OFF set point value, the corresponding fans will turn off.

**Stage #2:**

After a minimum interval, if the leaving water temperature is greater than the stage 2- ON water temperature set point value, compressor #1 unloader shall be de-energized.

Compressor #1 will now be fully loaded. **The unit is now at 50% capacity .**

**Stage #3:**

After a minimum time delay and if the leaving water temperature is greater than the stage 3 - ON water temperature set point value, compressor #2 & the liquid line solenoid of the circuit #2 is switched on. Also the compressor #1 will be unloaded.

The third stage of capacity is now achieved. **The unit is now at 75% capacity .**

As the discharge pressure of compressor #2 rises, the corresponding fans energized according to the fan stage-ON set point.

**Stage #4:**

If the leaving water temperature is greater than the stage 4 - ON water temperature set point value, the compressor #1 unloader shall be de-energized. **The unit is now operating at 100% capacity .**

**STAGE - OFF SEQUENCE**

During the staging OFF, the first-in last-out sequence is adopted, if equalization of compressor timing is not selected. Else the more used is switched off.

As the applied load decreases and when the leaving water temperature falls below the stage 4 -OFF water temperature set point value, stage 4 is turned off. Compressor #1 unloads.

If the leaving water temperature falls below the stage 3-OFF water temperature set point value, the stage 3 is turned off. The liquid line solenoid #2 is turned off and compressor #1 is loaded up to 100%.

When compressor #2 suction pressure falls below the pump down set point value, compressor #2 and the corresponding fans are turned off. The unit is now at 50% capacity.

Stage 2 and 1 are turned off in a similar manner to stages 4 & 3 mentioned above.

When the compressors are in the standby or OFF mode, pump down of the chiller is maintained. If the suction pressure rises above the pump down set point value the compressor will turn on with the liquid line solenoid closed. When the suction pressure falls below the pump down set point value, the compressor will be turned off.

**Compressor and Unloader Staging**

A one compressor unit has 2 stages, two compressor unit has 4 stages and a four compressor unit has 8 stages. The odd numbered stages turn compressors #1 ON or OFF while the even numbered stages de-energized the unloader. The staging of a standard unit is shown in the following chart:

Stage	Number of Compressors		
	1	2	4
1	1*	1*	1*
2	1	1	1
3		1*, 2	1*, 2
4		1, 2	1, 2
5			1*, 2, 3
6			1, 2, 3
7			1*, 2, 3, 4
8			1, 2, 3, 4

\*Indicates that compressor #1 is unloaded

**TROUBLESHOOTING GUIDE****1) No LED display lit or erratic display behavior**

- Check serial cable integrity.
- Check serial cable connections on both the User Interface Board and the Main Board.
- Check correct and tight insertion of jumpers JU1 and JU2 on the Main Board.
- Check correct and tight insertion of jumpers TU1 and TD1 on the User Interface Board and on the last board of the network.

**2) Controller does not respond to keypad**

- Check serial cable integrity.
- Check serial cable connections on both the User Interface Board and the Main Board.
- Check correct and tight insertion of jumpers TU1 and TD1 on the User Interface Board, main and/or auxiliary board.
- Check dip switches and integrity on the User Interface Board.

**3) Several analog values reading incorrectly**

- Check correct and tight connection of the probes to the board.
- Check the probe cable: test for short-circuit.
- The pressure transducer probe is a 4-20mA transmitter check the polarity of the connection on the Board.
- Check if the power supply voltage is into the specified limits: 24Vac +/- 10%.
- The temperature probe is a PTC sensor disconnect it from the board and measure its resistance that is 1000 ohm at 25°C or 1200 ohm at 50°C.

**4) Digital input reading incorrectly**

- Check if the auxiliary 115 Vac voltage is present in the electrical box.
- Check if the AC input on the Board is correctly connected to one of the 115 Vac terminals in the electrical box.
- Check if A1/A14 inputs are correctly connected with respect to the cabling diagram of the electrical box.

**5) No LCD display lit or erratic display behavior**

- Check serial cable integrity.
- Check serial cable connections on both the User Interface Board and the Main Board.
- Check correct and tight insertion of jumpers JU1 and JU2 on the Main Board.
- Check correct and tight insertion of jumpers TU1 and TD1 on the User Interface Board, main and/or auxiliary board.
- Adjust display intensity by rotating trimmer RV1 counter-clockwise (from the back side of the board).

## TROUBLESHOOTING GUIDE

**6) No LED H1 blinking light on NG3 Board**

- a) Check power supply cable an connection.
- b) Check if the power supply voltage is into the specified limits: 24Vac +/- 10%.
- c) Check for fuse F1, replace with 1AT/250V if blown.

**7) No display of leds on User Interface Board**

- a) Check serial cable integrity.
- b) Check serial cable connections on both the User Interface Board and the Main Board.
- c) Check correct and tight insertion of jumpers JU1 and JU2 on the Main Board.
- d) Check correct and tight insertion of jumpers TU1 and TD1 on the User Interface Board, main and/or auxiliary board.

**8) Auxilliary board not responding to commands**

- a) Check if LED H1 on Auxilliary board is blinking , if not go to point (6).
- b) Check serial cable integrity.
- c) Check serial cable connections on both the Main and the Auxilliary boards.
- d) Check that jumpers JU1 and JU2 on the Auxilliary boards are not installed.
- e) Check correct and tight insertion of jumpers TU1 and TD1 on the User Interface Board, main and/or auxiliary board.

**9) Analog Outputs not responding**

- a) Check Analog Output cables integrity (for short-circuit).
- b) Check Analog Output cabling and connections.
- c) Check if the power supply voltage is into the specified limits: 24VAC +/- 10%.
- d) Check the fuse F1, replace with 1AT/250V if blown.

**10) Digital Outputs not responding**

- a) Check Digital Output cables integrity (no short-circuit, no open-circuit).
- b) Check digits Output cabling and connections.
- c) Check if the power supply voltage is into the specified limits: 24VAC +/- 10%.
- d) Check the fuse F1, replace with 1AT/250V if blown.

**11) Serial Communication with Remote Monitoring Control not Functioning**

- a) Check the serial cable connected on plug-in board IS-485 mounted on the Main Board.
- b) Check if the plug-in board is correctly mounted on the Main Board.
- c) Check if jumpers X5 and X6 on the plug-in board IS-485 are correctly installed.
- d) Check if jumpers X17 and X18 on the GATEWAY board are correctly installed.

## APPLICATION DATA

**UNIT PLACEMENT:** Prior to unit installation, please check the following points. Strength, level of the base or foundation. Please refer unit installation clearance dimensional drawings for proper unit installation.

**CONDENSER AIRFLOW:** Obstructed flow of condenser air will effect the unit capacity and operating efficiency. It is essential to install the units where sufficient airflow available to eliminate condenser discharge air recirculation.

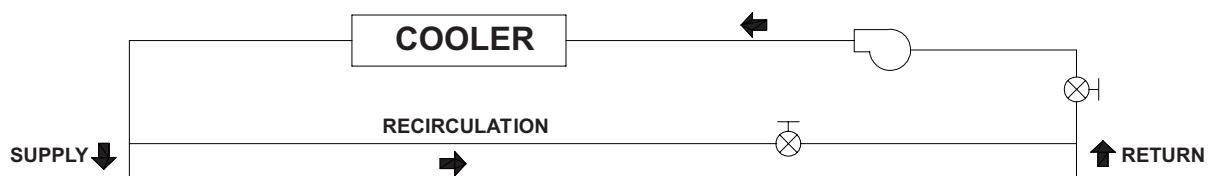

**WATER (FLUID STRAINERS):** It is recommended to install 20-mesh strainers in the fluid piping.

**COOLER ENTERING WATER TEMPERATURE:** Unit can start and pull down from 95°F (35°C) entering water temperature for sustained operation conditions. If entering water temperature is expected to be higher, contact engineering dept. for design modification.

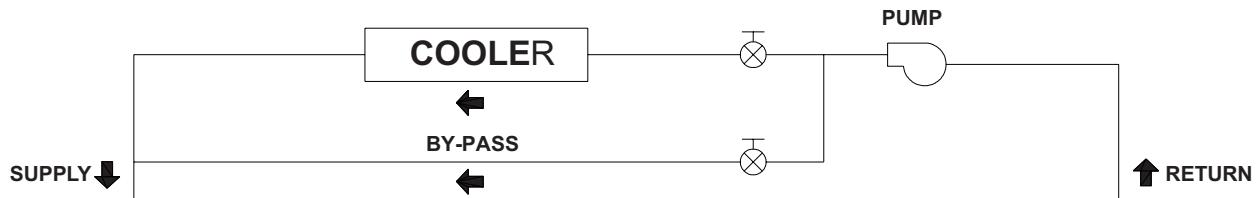

**HIGH AMBIENT TEMPERATURE:** Chillers can start and operate satisfactorily at 125 F (52°C) ambient temperature at nominal voltage.

**COOLER TEMPERATURE RISE:** Rating and performance data are for a cooling rise of 10°F. It is recommended that the cooler temperature rise not exceed 16°F (8.8°C).

It is recommended to recirculate the chilled water to increase the flow rate. Ensure to maintain the mixed fluid temperature entering to the cooler at least 5°F (2.0°C) above the leaving chilled water temperature.

It is recommended to maintain the pressure drop through the cooler within the limit by bypassing return water as shown on diagram below. This permits a higher temperature difference with lower water flow through the cooler and mixing after the cooler. However the flow rate through the cooler should not be lower than the minimum flow rates indicated in this catalog.

**OVERSIZING OF CHILLER:** It is not recommended to oversize the chiller more than 5 - 10% of the load for future requirement. Over sizing of chiller cause system inefficiency due to excessive compressor cycling which will reduce the compressor life. It is recommended to select the chiller for present load requirement and add another unit for future expansion. Units operate more efficient with fully loaded than larger equipment operates at minimum capacity.

**MINIMUM CHILLED WATER VOLUME:** As the compressor may alter between starting, loading, unloading and stopping in a closed coupled system, the leaving water temperature may vary by 2°F - 5°F (1°C - 2.5°C) per step of capacity control. The anti recycle timer will prevent the compressor from starting for 3 minutes and that influence the leaving water temperature variation. Therefore, in case where precise control of leaving temperature is absolutely required, it will be necessary to install a water tank in the chilled water loop. Table on next page indicate minimum tank volume for air conditioning and process application.

**Minimum loop volumes:** Normal air conditioning: 3 gal/Ton or 3.25 liters/KW.

Process cooling: 6 gal/ton or 6.5 liters/KW.

## RIGGING INSTRUCTIONS

**ATTENTION TO RIGGERS**

Hook rigging sling thru holes in base rail, as shown below.  
Holes in base rail are centered around the unit center of gravity.

Center of gravity is not unit center line.

Ensure center of gravity aligns with the main lifting point before lifting.

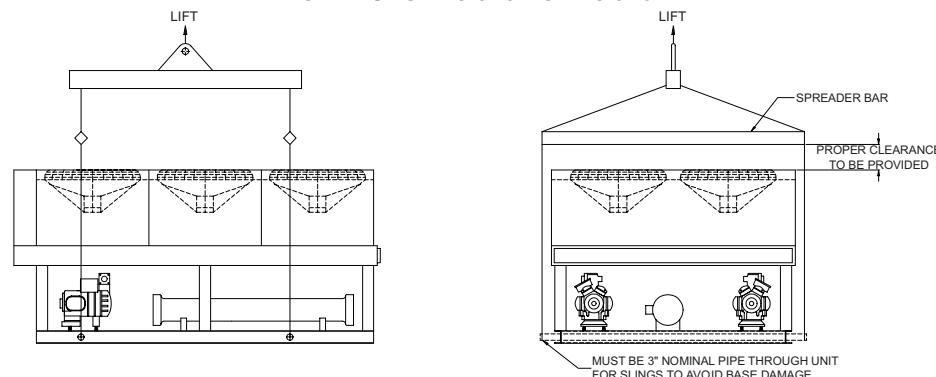

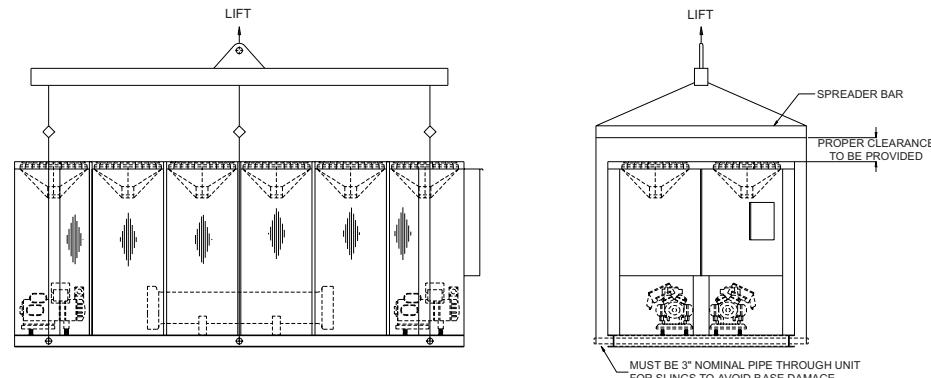

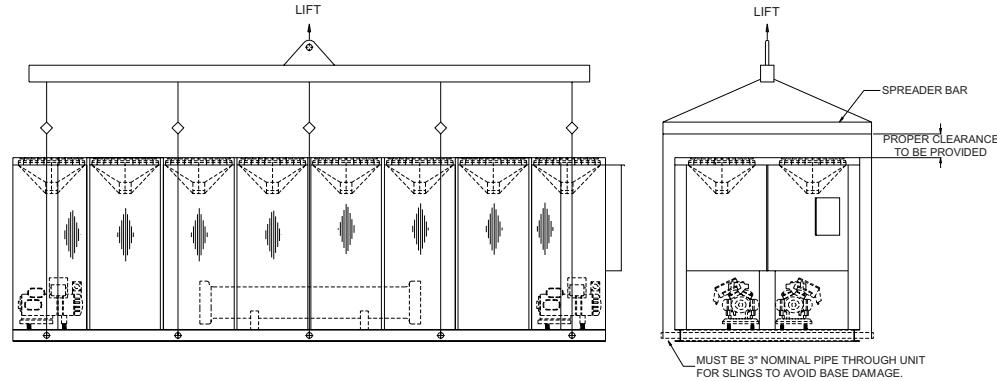

Use spreader bar when rigging, to prevent the slings from damaging the unit.

**CAUTION**

All panels should be in place when rigging.

Care must be taken to avoid damage to the coils during handling.

Insert packing material between coils & slings as necessary.
